Charlie Brown Pumpkin

Charlie Brown walk down the street, to see if he could find a pumpkin that he could carve or eat. He ended up in a store where he found everything and more. He looked all around and realized everything is made of matter, and he knew that the pumpkin for him would have great mass. Which means that if you dropped it off a building it would fall quite fast. Oh no thought Charlie Brown, I just remembered what I had forgot. I left the frig door open it was quite hot. He feared that the ice would go through physical change, and when he'd fall and get a boo boo , there would be no ice to cure his pain. As he ran home he found ice cream on the floor, and he knew that it was a heterogeneous mixture, unlike his very cool water statue fixture. He kept thinking of elements and compounds, Elements are the simplest guys that are forms of matter, that exist under normal laboratory conditions. Compounds are big-bellied boys that are substances that can be separated into simpler substances only by chemical mean.

He finally got into the kitchen and closed the door, And found a note that said his chemistry homework had been torn and he would have a test on Qualitative measurements, which is a result written in non-numerical form. But he knew he would have to study morebecause he didn't understand Quantitative measurements which gives results in numerical form. When he finally finished his work, he realized he had left his pumpkin in the back.

When he picked it up, he felt something soft, and he thought oh no it's the Big Fuzzly Wuzzy. He then found out that it was just mold, and this made him mad, for his once good pumpkin was now old. He thought to himself, maybe if I construct a chemical test, I can bring back the missing nucleus. But poor Charlie Brown did not know his chemistry very well. He forgot that once those protons, neutrons and electrons have changed, everything he would attempt would obviously fail.

Charlie Brown started to sing and thought of meters, Liters and all sorts of things. He thought of the prefixes in the metric system. He knew there were mega, kilo, deci, centi, milli and more. Charlie Brown finally laid down for bed, and reflected on the day and all the scientific things that had run through his head. He said good night to the great pumpkin, and closed his eyes and shunned any noise that could go thump and felt his body sore into his dreams, where all his happy thoughts would be his themes.
