

Chemistry is the study of the composition of matter

Learning about the stuff things are made of? I couldn't be gladder!

Inorganic, organic, analytical, and physical,

Studying these branches turn me utterly whimsical!

Medicine, agriculture, environment, and exploration too,

All areas helped by the study of chemistry, WOO!

The "method" consists of hypothesis, experiment, theory, law, and observation,

The lab write up could lead to a new discovery or creation!

Matter, mass, substance, physical properties,

Solid, liquid, vapor, gas; oh the possibilities!

Heterogeneous and homogeneous mixtures and solutions,

Could any of these combinations put an end to pollution?

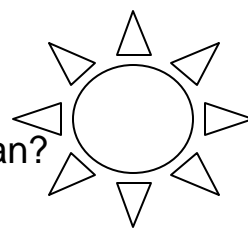

Elements and compounds deserve a category of their own,

Into the wee hours of the morning, these do we study and groan.

Reactions, reactants, properties and products,

Be careful and cautious with these, no improper conduct!

Quantitative and qualitative measurements, what do they mean?

Descriptions, numerical? I must be in a dream.

Multiplication, division, addition, and subtraction, wait, what? Trailing zeros?

Anyone who can figure out this "chemistry" thing is definitely my hero.
